SINGULAR INTEGRAL OPERATORS
EXERCISE V (28.11.2023)

Exercise 1 (1 point)**.** Prove that in $\mathbb{R}^n$ the family of all dyadic cubes containing 0 is $(1 - 2^{-n})$-sparse.

Exercise 2 (1 point)**.** Suppose that $\mathcal{F}_1, \ldots, \mathcal{F}_k$ are sparse families of dyadic cubes, and that each $\mathcal{F}_j$ is η_j-sparse for some $\eta_j \in (0, 1]$. Show that $\mathcal{F}_1 \cup \cdots \cup \mathcal{F}_k$ is $1/(\sum_{j=1}^k \eta_j^{-1})$-sparse.

    Hint: Use Proposition 7.8.

Exercise 3 (3 points)**.** For any $s \in (0, 1)$ let $w = |x|^{1-s}$ be a weight on $\mathbb{R}$.
  (i) Show that $w \in A_2$, and $[w]_{A_2} \lesssim s^{-1}$.
  (ii) Given $f_s(x) = x^{s-1}\mathbf{1}_{(0,1)}(x)$, show that $\|f_s\|_{L^2(w_s)} \lesssim s^{-1/2}$.
  (iii) Prove that $\|Hf_s\|_{L^2(w_s)} \geqslant 2s^{-3/2}$, and conclude that in the estimate
$$\|Hf\|_{L^2(w)} \leqslant C[w]_{A_2}\|f\|_{L^2(w)}$$
    the factor $[w]_{A_2}$ cannot be replaced by $[w]_{A_2}^t$ for any $t < 1$.
